### Abstract of EP0749746

Cosmetic compsns. consisting of fatty and powdered components comprise particles of surface-stabilised polymer dispersed in a fatty liq. medium. The liq. fatty medium is pref. chosen from non aq. liq. compsns. with an overall solubility parameter in the HANSEN interval of solubility of <17 (MPa)<sup>1/2</sup>; and/or monoalcohols with an overall solubility parameter in the HANSEN interval of solubility of <20 (MPa)<sup>1/2</sup>. The liq. fatty medium is selected from wax, oils, rubber and/or fatty greasy components which are silicon-base or of mineral, animal, plant and synthetic origin, fatty liquids include e.g. paraffin oil, vaseline or soya oil. The polymer may be a radical polymer, a polycondensate and/or a naturally occurring polymer. The polymer particles are surface stabilised by a sequenced polymer, a graft polymer and/or a statistical polymer.
